

# Extending Drupal With XML-RPC

Justin R. Miller  
Code Sorcery Workshop  
inquiry@codesorcery.net

Presented at the Washington DC Drupal MeetUp, April 4, 2007

Notes:

## 1) Drupal setup:

- This module is only tested with Drupal 4.6.x.
- To install the module, drop it into the modules directory and then enable it under **Administer->Modules**.
- You will need to run the asset.mysql SQL file through your MySQL database to create the assets table.
- You will need to grant the **manage assets** permission for your users.
- Proceed to **Administer->Assets** to manage assets.

## 2) Mac setup:

- Source code is provided, as is a pre-compiled Universal Binary. It should be compatible with Mac OS X 10.3 but has only been tested on 10.4.
- Open the preferences and enter your Drupal username, password, and website URL. There is no need to add the XML-RPC gateway path, as it will be added automatically. **Please note that your Drupal login info is not stored in the keychain but is stored in the regular preferences file, un-encrypted.**
- Drag a file to the main window or to the dock icon to prepare it for upload.
- After upload, the resulting asset URL will be copied to the clipboard for easy pasting.

Happy uploading!
